

Abstract

[0039] A convoluted boot for sealing an annular chamber filled with a lubricant between an outer joint part of a universal joint and a shaft connected to an inner joint part of a universal joint. The convoluted boot includes a first collar (2) to be fixed to the shaft, a second collar (3) to be fixed to an outer part of a universal joint as well as a boot portion (4) with a plurality of annular folds, which boot portion connects the two collars. Each of the annular folds (5) has a first annular flank facing the first collar (2) and a second annular flank facing the second collar (3), wherein the surface of at least one of the two annular flanks of at least one of the annular folds (5) comprises a plurality of raised portions which project from a uniform annular face or a plurality of recesses.
